Chapter 1

Analysis

1.1 Introduction

1.1.1 Client Identification

My client is my brother, Stuart Keppie, he is a former computing student who is currently studying Biological Sciences at the University of East Anglia and takes a keen interest in the urban sport skateboarding. He has a Sony Vaio laptop that he takes with him everywhere and therefore has mini applications that aid him through daily life and wants an application that will be able to cater all of his skateboarding, social and shopping advice needs. He likes utilising technology and has requested a program so that his life can be made easier.

1.1.2 Define the current system

Currently there is no single system available to cater for Stuarts activities. To aid ones learning in skateboarding the majority of people watch YouTube videos, this is done for a veriety of reasons. One being the fact that you are able to see in slow motion all of the movements that the person is doing to perform the trick. This is extremely useful, especially for a biology student, as you can theoretically replicate these muscle movements to perform the desired trick. To keep a record of what tricks you can do the current system is a pad and pen. The reason it is useful to keep a note of all your tricks is so that you feel that you have accomplished something within the sport, showing your accomplishments to your friends and remembering what tricks you have to use in competitions or games of S.K.A.T.E. For skateboarders 'spots' are locations that are fun to skate and for people to find them you can google them. Some people have tried creating applications such as www.skatespots.

co.uk and www.extremesportsmap.com/uk/. For skateboard shopping advice one would have to research extensively the pros and cons of each product and then make a final descision based on what is the best product for the use. This can be extremely time consuming as all the reviews are not in the same place and therfore you have to not only read through all the reviews but navigate from different websites to get the best idea of what a skteboarders view is on that specific product.

1.1.3 Describe the problems

There is no uniformed program for the system, which in itself is the main problem. Having to use multiple systems to carry out taskscauses Stuart's laptop to waste power and ultimately battery. Due to multiple web pages needing to be opened at one time on top of navigating through the internet is not time efficient which ultimately will lead to more computer activity which would drain the battery of the laptop more quickly. This can be an issue as if you run out of battery at the skate park then you will have nowhere to charge the laptop. The current system isn't efficient in being able to easily access all the necessary information. For example to find a place to go skate nearby and then to get inspiration of what tricks to do and then learn a trick you would need to have atleast 3 web pages open, two of which will heavily use the CPU power, thus draining the battery due to the video streaming and advertisments. This current method is very time consuming and is a waste of time. Using YouTube as a source of learning skateboarding tricks can be useful, but some of the videos aren't useful and therefore they can be a waste of time to watch. Baised reviews of products by people that are paid to give a good review is a big problem in this industry, and therefore people can make ill-informed decisions on which product to buy. This is due to companies paying people/automated review writers.

1.1.4 Section appendix

Analysis section interview

1. What is the current system used?

Google Maps is used for locating possible skate spots. YouTube is used for new trick learning. Have to manually google for items to purchase.

2. What problems does this system cause you?

Maps does not have a skatepark search feature, skate spots can generally only be found if their name is known or when using a different website. Some YouTube videos have location restrictions. Online skateboard reviews can have bias.

3. What data is being recorded to carry out your tasks with the current system?

Search inputs

4. What extra data do you need to store/not need to store?

Tricks completed will be a new variable for storage.

5. How frequently will you need to edit the data?

On a daily basis, whenever the software is accessed.

6. Will data be deleted/added frequently? If so, how often?

Stored data will probably be amended daily, or every few days.

7. What processes are performed by the current system?

Satellite view presentation, general location search feature, video streaming.

8. What processes would you like to see in the new system?

Specific skate spot searching, relevant filtering or categorisation of skateboard videos, unbiased reviews of products.

9. When should these new processes be used in the new system?

When searching for skate spots. Categorising videos in the help section.

10. Which processes should be manually completed?

When the user has to select the filtering options. Adding new tricks to the database.

11. What are the inputs/outputs to the current system?

Adding a skate spot.

12. Are there any new inputs/outputs needed for the new system?

Current location, trick names, trick description, product details.

13. Is the application purely computer based, or are hard copies of data needed?

Computer based.

14. What are your computer specifications (inc. Operating System)?

- Sony Vaio e15
- Microsoft Windows 7 Home Premium OS
- 500 GB HDD Memory
- 8GB RAM
- Intel Core i5 Quad Core Processor
- Intel HD3000 Graphics Card

15. Is security a problem?

Current location input shouldn't be let out without permission (privacy of whereabouts).

16. How should errors be reported in the new system?

GUI pop-up and error message sent to software developer.

17. Are there any constraints? (cost, time, data, software, hardware etc.)

The software needs to be time efficient, to maximise time available to spend on the activity the software aids.

18. How many people will be using the new system?

One user per system. One system initially, but if the software is good it will be recommended to other users for synchronisation.

19. If greater than one, what information should other users have about your account?

Progress level (how many tricks learnt etc.), skate spots visited.

20. What should the new system achieve?

Able to perform/navigate to all current tasks from one navigation menu. Not need separate programs for each task. Have social compatability ie. Connectivity to peers.

21. Do you have a particular solution in mind to tackle any specific problems?

N/A

22. Is installing additional software an issue?

No.

23. Any extra notes?

N/A

24. How many hard coded tricks would you like in the database?

50 tricks in the database initially, and then allow for personal user additions.

1.2 Investigation

1.2.1 The current system

The current system is split into 4 sub systems. These systems are:

- $\bullet\,$ You Tube - for learning tricks.
- Notepad for tricks.
- Google maps and other websites for finding skate parks and spots.
- \bullet googling reviews on the internet for buying guidance.

Data sources and destinations

Some of these systems have multiple data sources and destinations and none of the systems overlap in data sources and destinations.

Data	Data	Data Example	Data Destination	
Source				
User	Search keywords	How to kickflip	YouTube Servers

Algorithms

Algorithm 1 Algorithm to show deciding on a new trick to learn

```
1: Trick \leftarrow \mathbf{USERINPUT}
```

- 2: IF Trick = True THEN
- 3: **OUTPUT** "You can do this trick"
- 4: **OUTPUT** "Write trick in note pad"
- 5: **ELSE**
- 6: **OUTPUT** "You can't do this trick"
- 7: **ENDIF**

Algorithm 2 Deciding whether to search how to learn a trick

```
1: Trick \leftarrow \mathbf{USERINPUT}
```

- 2: IF Trick = True THEN
- 3: **OUTPUT** "Search for a YouTube video"
- 4: **ELSE**
- 5: **OUTPUT** "Don't search for a YouTube video
- 6: ENDIF

Algorithm 3 Algorithm for learning tricks

```
1: "Trick" \leftarrow USERINPUT
```

- $2:\ finished \leftarrow false$
- 3:
- 4: WHILE notfinished
- 5: **OUTPUT** Attempt trick
- 6: **IF** Trick = False **THEN**
- 7: **OUTPUT** "Try again"
- 8: **ELSE**
- 9: $finished \leftarrow true$
- 10: **ENDIF**
- 11: ENDWHILE
- 12: **OUTPUT** "Trick completed"

Algorithm 4 Algorithm for watching videos

```
1: OUTPUT Open InternetBrowser
2: OUTPUT Load www.YouTube.com
3: Trick ← USERINPUT
4: OUTPUT Type Trick tutorial into YouTube Search Bar
5: OUTPUT Press the Enter key
6: OUTPUT Find appropriate tutorial link
7: OUTPUT Click the thumbnail
8: OUTPUT Watch the video
```

Algorithm 5 Finding Skate Spots

```
    "Bored" ← USERINPUT
    IF Bored = True THEN
    OUTPUT "Search for a skate spot"
    ELSE
    OUTPUT "Don't search for a skate spot
    ENDIF
```

Algorithm 6 Finding Reviews and Deciding on a Purchase

```
1: finished \leftarrow false
2:
3:
   WHILE not finished
      IF Skate part broken = True THEN
4:
         OUTPUT "Search for a review"
5:
         IF part_review = good THEN
6:
            OUTPUT "Consider Purchasing"
7:
            IF purchased = True THEN
8:
                finished \leftarrow true
9:
            ENDIF
10:
         ELSE
11:
            OUTPUT "Keep searching for a replacement part"
12:
         ENDIF
13:
      ENDIF
14:
15: ENDWHILE
```

Data flow diagram

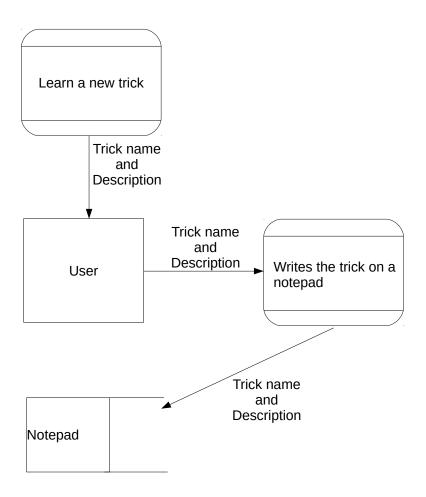

Figure 1.2: Data Flow Diagram of writing recently learnt tricks on a note pad

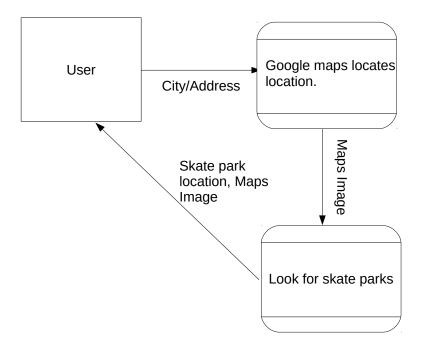

Figure 1.3: Data Flow Diagram of Searching for a skate park

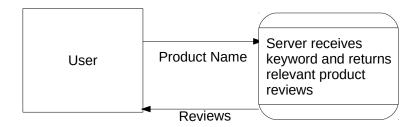

Figure 1.4: Data Flow Diagram of Searching for reviews of a product

Input Forms, Output Forms, Report Formats

The only input form in the current system is Stu's notepad which contains data about his tricks that he has learnt. I have taken a page from his notepad (see image below) of details about his time at Saffron Walden skate park on Friday the 26th of September. His input form contains data about the obsitcles at the skate park, the tricks he learnt on that day and tricks that he saw and possibly wants to try and learn.

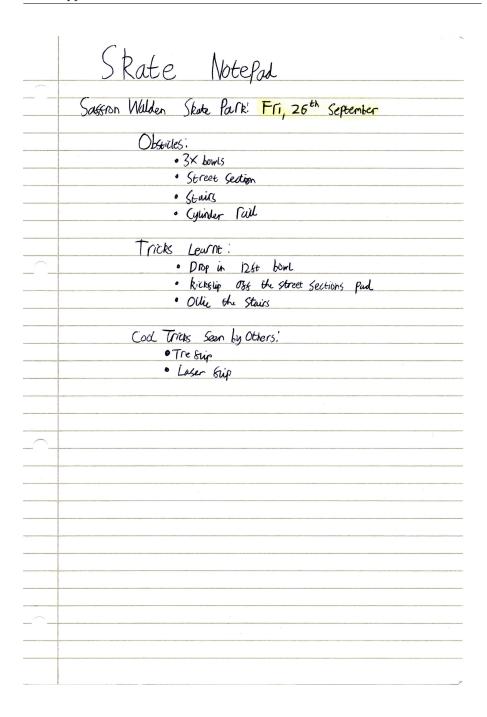

Figure 1.5: A page from Stuarts notepad

The only output forms in the current system would be the YouTube video links at redirect you to the YouTube video. A couple of these output links are listed below:

- How To Ollie Tutorial https://www.youtube.com/watch?v=FuyYBWuV7VU&index=1&list=PLIZKb9hZiA_uFdK_zu9d_E_8gydHx5kwy
- How To Kickflip Tutorial https://www.youtube.com/watch?v=_7fEsZG1xuI&index=2&list=PLIZKb9hZiA_uFdK_zu9d_E_8gydHx5kwy

1.2.2 The proposed system

Data sources and destinations

The new system keeps some of the same data sources and destinations as the current system. For example YouTube will still be the source of the tutorial videos and google maps will still be used as the basis for mapping. But all of the other data will be stored internally within the system to increase the ease of access.

Volumetrics

For the initial size of the propsed system I chose to add 50 standard skate boarding tricks as there are limitless tricks and the user is able to add tricks to his own individual database of tricks and my client requested it (See the section appendix question 24). The maximum length of a name for a skateboarding trick is 25 characters, this is because they range from words such as "shuv" to "triple doliphin late flip". With the initial program as there will be 30 standard skateboarding tricks the names of them alone would take up 750 bytes as a string takes up 1 byte per character. The tickbox next to the trick stating whether you have completed the trick or not would take a boolean value and therefore take up 60 bytes of storage as boolean values take up 2 bytes each. The description of a trick would approximately be 100 characters, for example the description of a kickflip would be:

 \bullet Flipping the board 360 $^{\circ}$ along the axis that extends from the nose to the tail of the deck.

This will add a further 3000 bytes to the program. The location coordinates of the skatepark will have to be stored, and the skateparks and spots around Cambridge is roughly 20 and each skatepark will contain 2 integers (the coordinates) and as integers take up 4 bytes of storage each the stored coordinates will initially be 160 bytes. The maximum length of YouTube link would be 100 characters and as there are 50 tricks already implemented there will be 50 links, this ultimately adds up to a further 5000 bytes. images will be 670x503 which totals to 337010 bytes each and a total of 50 images will be needed which means in total 16850500 bytes if memory will be needed for images.

Adding up all of the bytes of data would be calculated by the sum:

750+60+3000+160+5000+16850500 = 16859470Bytes

To get this unit in KB you would divide the number of bytes by 1024 which equals 16464.3 KB (Rounded to 1 d.p)

To get this unit in MB you would divide by a further 1024 which equals 16.1 MB (Rounded to 1 d.p)

As this system will be ever expanding in the number of tricks that are added to the database the actual systems data size will be larger as time goes on.

1.3 Objectives

1.3.1 General Objectives

- Aesthetically pleasing, easy to navigate GUI.
- Videos organised and filtering capabilities.

- Correct and accurate mapping to the skate parks/spots.
- Correct directions from current location to skate park/ spot on the map.
- Non-biased reviews.
- Clear database with a list of tricks in.
- Easy to filter through tricks known.

1.3.2 Specific Objectives

- Ensure that videos can be filtered by categories. e.g easy, medium, hard tricks.
- Ensure that videos load correctly and are linked to the right video.
- Ensure that videos are displayed at the correct size/resolution that the monitor of the computer is.
- Ensure the database can add, edit and remove trick data (Name, description, image, completed status and tutorial link).
- Ensure that the database is displayed correctly inside the application at all resolutions.
- Ensure that the tricks are marked by how hard they are by a three way scale of: Easy, Medium or Hard.
- Ensure a checkbox is by the side of a trick to represent whether the user has completed that trick or not.
- Ensure there is a search bar for a specific trick name.
- Ensure there are filters for tricks e.g Switch trick filters.
- Ensure that the map is accurate to current roads.
- Ensure location of the user is not revealed to anyone else.
- Ensure that the current location marker is accurate.
- Ensure that when giving directions to skate parks from your current location that the mapping route is correct and on viable roads.
- Ensure that the program can mark skate park locations.
- Ensure no biased reviews are posted to the app and that they're moderated before they are universally posted.
- Ensure the program runs fast without lag when navigating between areas of the application.

1.3.3 Core Objectives

- Ensure that videos can be filtered by categories. e.g easy, medium, hard tricks.
- Ensure that videos load correctly and are linked to the right video.
- Ensure the database can add, edit and remove trick data (Name, description, image, completed status and tutorial link).
- Ensure that the tricks are marked by how hard they are by a three way scale of: Easy, Medium or Hard.
- Ensure a checkbox is by the side of a trick to represent whether the user has completed that trick or not.
- Ensure there is a search bar for a specific trick name.
- Ensure there are filters for tricks e.g Switch trick filters.
- Ensure that the program can mark skate park locations.
- Ensure the program runs fast without lag when navigating between areas of the application.

1.3.4 Other Objectives

- Ensure that videos are displayed at the correct size/resolution that the monitor of the computer is.
- Ensure that the database is displayed correctly inside the application at all resolutions.
- Ensure that the map is accurate to current roads.
- Ensure location of the user is not revealed to anyone else.
- Ensure that the current location marker is accurate.
- Ensure that when giving directions to skate parks from yout current location that the mapping route is correct and on viable roads.
- Ensure no biased reviews are posted to the app and that they're moderated before they are universally posted.

1.6 Other Abstractions and Graphs

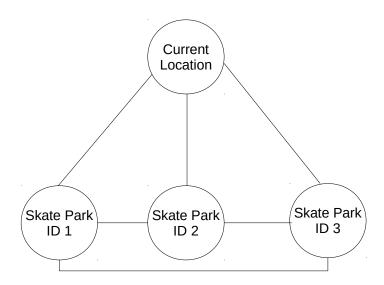

Figure 1.13: Graph to show how the user can map their current location to skateparks.

1.7 Constraints

1.7.1 Hardware

The new system will need to be able to run on Stuart's computer, the current specification of Stuart's laptop is:

- 15.6" HD 1366x768 Screen
- \bullet i
5-2450M Dual Core Processor (Sandy Bridge) 2.5 GHz (overclocked to 3.1
GHz) 3MB Cache
- 8GB DDR3 RAM
- \bullet 500GB HDD Memory
- Intel HD3000 Graphics Card

Stuarts laptop has more than enough processing power in order to run the new system, this will allow Stuart to run several applications whilst also using the new system. Stuart will be able to take the application with him wherever he takes his laptop. Therefore portability of the application isn't limited as he works on a laptop.

The only constraints will be the screen resolution and battery of his laptop, therefore optimising the program for his specific resolution will be a task to overcome and making the program universal for other users to run the program.

1.7.2Software

Stuarts laptop is currently running on Windows 7 Home Premium, he does not want to have to install a virtual machine to run the application; however he does not mind installing external software to aid the systems running capability and ease. The new system however was initially thought to run on Windows 7 Home Premium and therefore this is not an issue. Stuart being willing to install extra programs gives some extra flexibility with how to overcome other problems if they arise. Therefore currently there are no foreseeable constraints regarding software.

1.7.3Time

Currently the only time restriction is the project deadline, this is Friday 13h February 2015 for the implementation section of the coursework, this was set by my teacher. Stuart is extremely flexible with time and isn't under any time constraints as long as the final product works.

1.7.4User Knowledge

As an ex-computing student and a person regularly around computers, Stuart's knowledge about computers and the way that they work is good and therefore he is capable of understanding and explaining complex processes. This means that in the designing process of the new system I will be able to plan for keyboard shortcuts and more complex features which will essentially.

1.7.5Access restrictions

Restricting the data about the individual's location is an important feature of the application, other than that the information that is inputted into the system is general and therefore it does not need its access restricted. This lack of access restriction is in place as other users should be able to benefit from the skate parks and spots that another user has found. Due to the system not containing private information about a living individual, the new system will have no problems with any current legislation or law.

1.8 Limitations

1.8.1 Areas which will not be included in computerisation

The process of learning tricks will still have to be done physically as it cannot be completed any other way, the same goes for seeing other people's tricks and being inspired to learn a new trick. Apart from that, all of the information will be stored in the system electronically and processed by the computer.

1.8.2 Areas considered for future computerisation

- A forum for users of the app to discuss problems, help each other and recomend products.
- Phone app.

1.9 Solutions

1.9.1 Alternative solutions

Solution	Advantages	Disadvantages
Web-Based Application	 Can access anywhere with an internet connection/LAN connection. No installation required. Nice formatting and extremely versatile. Can use a lot of different programming languages to accomplish a task (HTML, CSS, JavaScript, PHP etc.) 	 Lack of experience in web based programming. More complex security for hiding locations. Web Hosting costs money. More extensive knowledge to fix problems.

Making the current system more efficient	 No need for the client to learn anything new. No expense. 	 Problems with the current system will still exist. The system won't be as efficient.
Command-Line Application	 Runs extremely fast. Uses minimal system resources. 	 Client will need to learn code. Security would be hard to keep as there are 'hidden' codes. No GUI. Coding error could break the computer.
SQL Database	 Runs complex queries fast. Could store all the information in a compressed form. Information easy to access. 	 No GUI. Client would have to learn SQL code. I am not very good at SQL code. Debugging would be difficult.
Python Application with GUI (PyQt4)	 Python is my primary programming language. Easy to use for the client. Nice, clean GUI. Versatile GUI and Python allows for the program to work on all types of systems. Easy to format data. 	 Uses system resources more than other solutions. Programming can be complex (GUI is harder than command-line).

1.9.2 Justification of chosen solution

I have chosen to complete the new system using a Python application with a PyQt Graphical User Interface. I have chosen to create the system in this way as python is a programming language that is extremely versatile and will be able to carry out all of the tasks whilst supplying the client with a smooth and efficient experience. A web-based solution would not be appropriate as neither

the client nor I am willing to pay to set up a server and also I do not have extensive knowledge and experience with working with programming languages such as: HTML, CSS, JavaScript and PHP. Making the current system more suitable would not be suitable either as the main problems with the current system would still appear in the new system, the client and I do not see this to be a worthy way to tackle this system. A command-line application would be too complicated for everyday use due to its steep learning curve and additionally the security threats are too high. Finally an SQL database doesn't provide a clean GUI like the python solution does and isn't as versatile in the ways that you can input and read data, which leaves me to believe that using the Python application is the most suitable for undertaking the new system. Python also contains extensive forums with information to help the client add any additional features he wants when my project is completed whilst also aiding me to find the best way to tackle the problems that I will encounter when programming the new system.

Chapter 2

Design

2.1 Overall System Design

2.1.1 Short description of the main parts of the system

Start-Up Wizard

- General User Interface
- Adding a Profile

General User Interface for the Start-Up Wizard

The general user interface for the start-up wizard will consist of a paragraph of text, containing information on how to proceed with setting up a profile and 3 text boxes to enter your name and email. An additional 'browse' button is available to select a profile picture. A save button at the bottom of the window is there to save all the changes.

Adding a Profile

The start-up wizard appears if no profile information can be found in the database. The start-up wizard allows you to add your name and email and to select a profile picture. Once all the information has been filled in the changes will be saved and the actual application will load up, personalised with the information that you have entered in the start-up wizard.

Profile

- General User Interface
- Editing Profile Information

General User Interface for the Profile

The general user interface for the profile will consist of a picutre, name, email and recent completed tricks, above the main window there will be tabs containing the other areas of the system and above that will be an option to edit your profile. Additionally a progress bar showing the percentage of tricks completed will be displayed at the bottom of the window.

Editing Profile Information

One the 'Edit profile' button is clicked on the menu bar a drop down appears with the options:

- Change Profile Picture
- Change Name
- Change Email

Once the 'Change Profile Picture' button is pressed you will be redirected to browse your documents for a picture, the picture will be resized to 160x160 pixels. When the 'Change Name' button is pressed a pop-out dialogue box will appear with the opportunity to change your name and a 'save' button below that to save your new name. When the 'Change Email' button is pressed a pop-out dialogue box will appear and present you with a text box to enter a new email, this is validated to ensure the email is correct, A 'save' button is displayed below and when clicked it will save your new email.

Trick Table

- General User Interface
- Adding a Trick
- Deleting a Trick
- Editing a Trick
- Completing a Trick
- Progress Tracker

General User Interface for the Trick Table

The general user interface for the trick table will consist of a table in the middle of the application, search filters will be placed on the side of the application and options to add a trick at the top of the application. By the side of each trick there a choice to delete or edit existing tricks. The columns of the table will consist of:

- Trick Creator (The Trick Creator contain the first and last name of the user who added the trick to the database)
- Trick Name (The Trick Name contains the name of the skateboard trick)
- Trick Description (The Trick Description will contain a short description of the trick)

- Trick Obstacle (The Trick obstacle will say if a specific obstacle is needed for the trick)
- Trick Image (The Trick Image will be contain a 670x503 pixel image of the trick)
- Trick Tutorial (The Trick Tutorial will contain a YouTube tutorial link to the trick)
- Trick Difficulty (The Trick Difficulty will contain either: Easy, Medium or hard depending on how difficult the trick is)
- Trick Completed (The Trick Copleted will contain a tick box along with the date that the tick box became ticked)

Below the option to add a new trick will be tabs containing other areas of the system.

Adding a Trick to the Trick Table

When the addition button (+) is pressed, a pop out will appear. This will automatically fill in the Trick Creator's name (first name and last name). Whilst the rest of the information will be readily available to edit. For example, Trick Name, Description, Obstacle and Tutorial will all have a text box to fill in freely, whilst the trick image will have an 'upload' button where you will be able to search your computer for an image which will automatically be re-sized to 670x503 pixels. The Trick Difficulty will be selected via a drop box with the three options: Easy, Medium and Hard and the Trick Completed will be a tick box. The Trick Tutorial text box will be checked for a correct youtube link. Once all the information has been added the trick will be added to the database and the trick will be able to be seen inside the table when on the Trick Database page.

Deleting a Trick from the Trick Table

By the side of every trick in the Trick Table there will be a 'bin' icon which gives you the option to delete a trick from your table. Once this is clicked a confirmation will pop up to ensure that you want to permanently delete that trick. Once that trick is deleted it wil be removed from the database and you will no longer be able to view it in your table of tricks.

Editing a Trick in the Trick Table

By the side of every trick in the Trick Table there will be a 'pencil' icon which gives you the option to edit a trick in your table. Once this is clicked a pop up identical to the one that you are given when you click on the (+) button comes up; however all of the information is already filled in with the information from that trick. From this pop up you can edit that specific tricks information, just as you would if you were adding a trick.

Completing a Trick in the Trick Table

Once the user has ticked a trick to its completed state, the tick box will display a tick and below it will have the date that the trick has been ticked. This date will be generated via the computers date.

Progress Tracker

At the bottom of the application a bar containing the status of the user's progress is displayed. This will contain information of how many tricks you have completed out of the tricks in the trick table.

Skatepark Map Marker

- General User Interface
- Adding a Skatepark
- Deleting a Skatepark
- Editing a Skatepark
- Mapping From Location to a Skatepark

General User Interface for the Skatepark Map Marker

The general interface for the Skatepark Map Marker is a Google maps image with markers locating skateparks and skate spots around the UK. Below the Google maps graph will be two text boxes where you will be able to type in two locations and a 'Map Journey' button to the right of both boxes. When a marker on the map is clicked on information about that skatepark is given in a dialogue box. Also in the dialogue box will be two options to edit and delete the skatepark, the symbols for these are a pencil and a bin, respectively. Above the graph will be an option to add a skatepark, shown by an addition sign. Below the option to add a new Skatepark will be tabs containing other areas of the system.

Adding a Skatepark

In the top menu bar of the Skatepark Map Marker window there will be an addition symbol (+), identical to that of the one in the Trick Table window with the functinality of adding a skatepark to the map. Once the symbol is pressed the user will be prompted with a pop-up which contains 3 text boxes and a confirm button. The three text boxes will allow the user to add the Name, Coordinates and Description of the skatepark that they are adding. The coordinates are validated by being in the correct format. The Name and Description are freely entered by the user. Once the confirm button is pressed the information for the skatepark is stored and a marker is placed on the map.

Deleting a Skatepark

When the bin symbol is pressed inside the marker dialogue box a pop-up will be displayed asking the user if they want to permenantly delete that skatepark. Once the skatepark is deleted you will no longer be able to view the marker of information on the map.

Editing a Skatepark

Once the pencil button is clicked a pop up identical to the one that you are given when you click on the (+) button comes up; however all of the information is already filled in with the information from that skatepark. From this pop up you can edit that specific skateparks information, just as you would if you were adding a skatepark.

Mapping From a Location to a Skatepark

Below the map there are two text boxes where you can enter two addresses and then click on the 'Map Route' button to the right of both of these which will then show the route on the Google maps image above.

Review Window

- General User Interface
- Add a Review
- Editing a Review
- Deleting a Review
- Filtering Reviews

General User Interface for the Review Window

The general user interface for the Review table will consist of a table in the middle of the application with search filters on the side of the application and options to add a review at the top of the application and if you're the creator of a review then a pencil will be beside your review so that you can edit the details of it and a bin so that you can delete your review. The columns of the table will consist of:

- Product Type
- Product Size
- Product Brand
- Product Name
- Rating
- Review
- Review Creator

Below the option to add a new review will be tabs containing other areas of the system.

Adding a Review

When the addition button (+) is pressed (at the top of the window), a pop out will appear. This will automatically fill in the Review Creator (first name and

last name). below this drop down boxes allowing you to choose the: Product Type, Product Size and Product Brand. Below the drop down boxes the information is inserted via a text box, the user can give a product a rating restricted to 1-5 and type out a review of up to 500 characters. Once all the information has been added the review will be added to the database and the review will be able to be seen inside the table when on the Review Database page.

Editing a Review

By the side of any review that you have created there will be a 'pencil' icon which gives you the option to edit your in your table. Once this is clicked a pop up identical to the one that you are given when you click on the (+) button comes up; however all of the information is already filled in with the information from that review. From this pop up you can edit that specific reviews information, just as you would if you were adding a review.

Deleting a Review

By the side of any review that you have created there will be a 'bin' icon which gives you the option to delete a review from your table. Once this is clicked a confirmation will pop up to ensure that you want to permanently delete that review. Once that trick is deleted it wil be removed from the database and you will no longer be able to view it in your table of reviews.

Filtering Reviews

At the top of the application there are search filters represented by the drop down box, you can then click on each individual filter and select the appropriate values. There will be 3 search filters, Brand (the company that makes the product), Type (the part of the skateboard), Size (the size of the product). When the filters are selected it will systematically reduce the number of items in the table in response to the filters put in place.

$\mathbf{2.1.2}$ System flowcharts showing an overview of the complete system

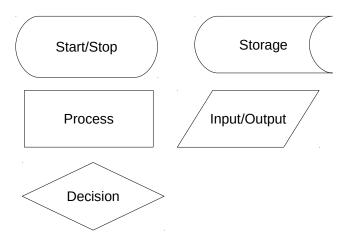

Figure 2.1: System Flowchart Key

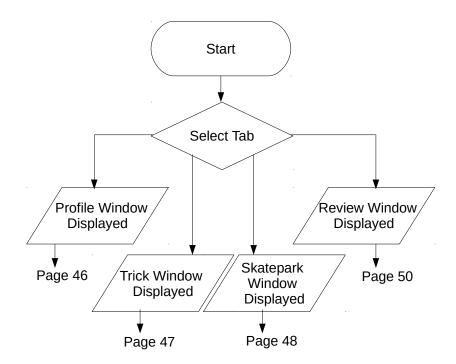

Figure 2.2: Profile Window Flowchart

The flowchart above shows the flow of operations between tabs.

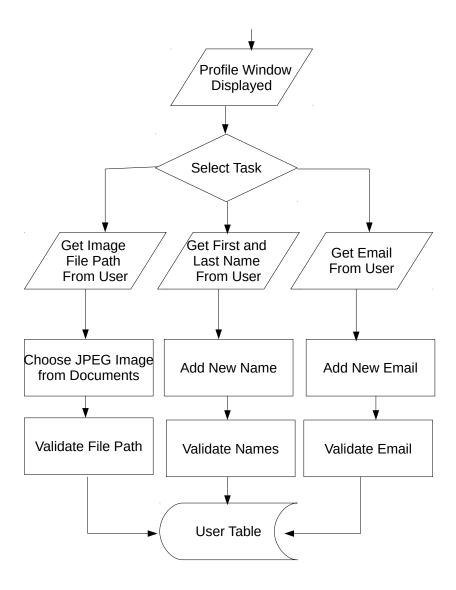

Figure 2.3: Profile Window Flowchart

The flowchart above displays the profile windows flow of operations. This shows the user is able to change their information, such as: Name, email and picture.

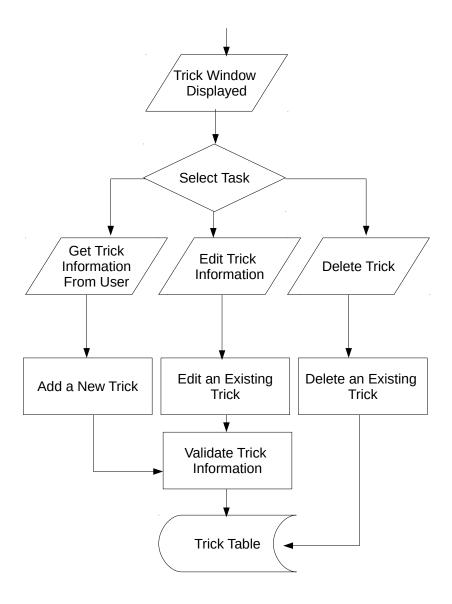

Figure 2.4: Trick Window Flowchart

The flowchart above displays the trick windows flow of operations. This shows the user is able to: add, edit and delete tricks.

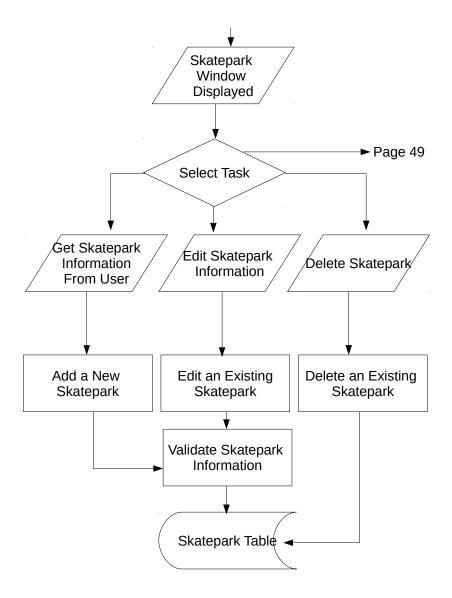

Figure 2.5: Skatepark Window Flowchart

The flowchart above displays the skatepark windows flow of operation. This shows the user can: add, edit and delete skateparks on and off of their map.

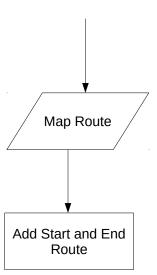

Figure 2.6: Skatepark Window Flowchart

The flowchart above is continued on from the previous flowchart and shows the user can map a route from location to location.

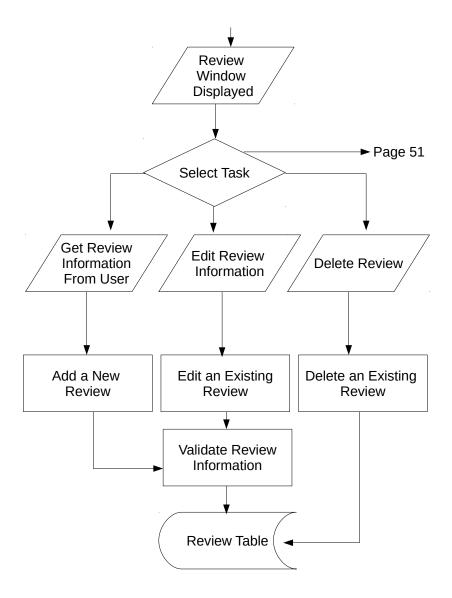

Figure 2.7: Review Window Flowchart

The flowchart above displays the review windows flow of operation. This shows the user can: add, edit and delete reviews.

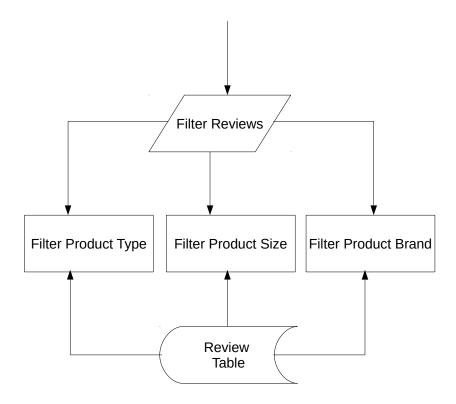

Figure 2.8: Review Window Flowchart

The flowchart above is continued on from the previous flowchart and shows the user can filter reviews via: brands, size and type.

2.2 User Interface Designs

The User Interface shown below occurs on a one off occasion when no profile information is found in the database. This screen allows the user to add a profile. This allows you to add your name, email and picture to your profile. A introductory message is also included to guide the user through the set-up process.

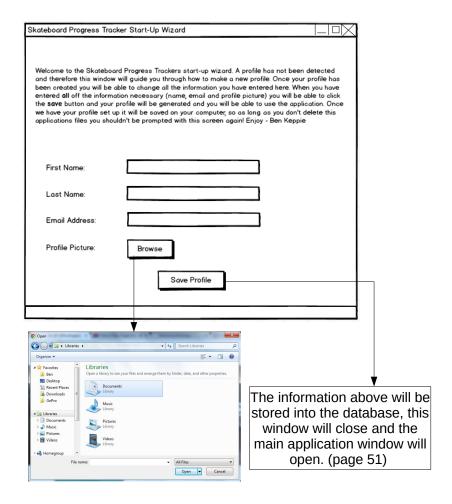

Figure 2.9: The User Interface for the Start-Up Wizard

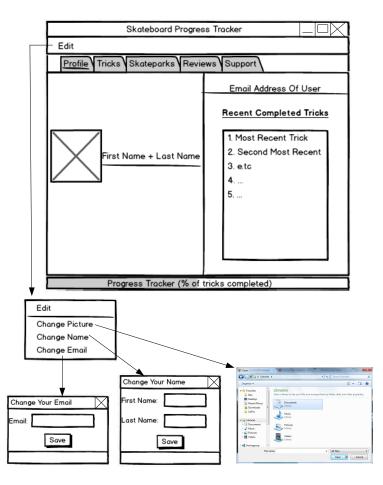

Figure 2.10: The User Interface for the profile section

This is the start-up page (the profile) of the application once a profile has been created. It contains the users profile with an image, name, email, progress tracker and a list of recently completed tricks. All of the information can be edited by the 'Edit' menu bar which contains 3 options (change profile picture, change name and change the email address). The tabs below the menu bar can be used to navigate between the windows of the application. These are displayed on each window and kept in the same position for ease of use. There is also a progress tracker at the bottom of the window where the user can see how many tricks they have completed out of the tricks in there table.

Figure 2.11: The User Interface for the trick section

The Tricks window of the application contains the same progress tracker as discussed in the profile user interface and a table in the main window full of tricks and their information. By the side of each trick there are icons including a pencil and a bin which represent 'edit' and 'delete'. I have decided to use these icons as they're recognisable, aesthetically pleasing and don't use up as much space as words, this allows for the table to be bigger. To add a trick the user can click the (+) symbol from the menu bar.

Figure 2.12: The User Interface for the skatepark section

The skatepark window contains a Google maps image in the centre of the window with a start and finish destination which can be used to map a route on the Google maps image. Once a skatepark is clicked on the maps information about that skatepark is given and there are options to edit and delete it, represented by a pencil and bin. I have used these symbols continuously through my application so that the user knows what the symbols mean. In the menu bar there is a (+) symbol which is used to add a new skatepark.

Figure 2.13: The User Interface for the review section

Like the trick window the review window has a table in the main window with a pencil and bin next to each row, and a (+) symbol is used to add a review. This continuity and re-use of symbols is all in place for ease of use. See the next page for filtering the review table.

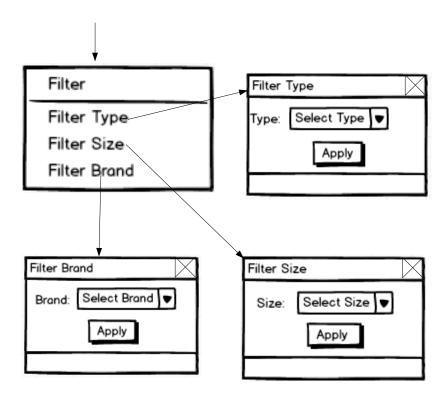

Figure 2.14: The continued User Interface for the review section

In the menu bar there is a 'Filter' option which allows for the user to filter the table for: Type, Brand and Size. These filters are in place so that the user can easily filter and narrow down the table to find the reviews that you want.

Figure 2.15: The User Interface for the support section

This window is available so that if there are any problems any user can contact the developer to fix them.

2.3 Hardware Specification

The system will need to run on Stuart's laptop. This means the program will have to work with a 1360x768, 16:9 aspect ratio screen and also windows 7. This is important as I have to make sure my program will fit on this screen size as the program is being built to Stuarts laptop specifications. This is an important

factor as all of the applications features will need to be aesthetically pleasing in many areas of the application such as the tables of information and the skatepark mapping section. A keyboard will be needed for inputting the information to the program, such as adding tricks or skateparks to the database. A track pad/mouse will be used to navigate around the program and the laptop screen will be used for the output of the program. The database and application data will be be stored on the hard drive of the user. The cost of extra hardware totals to £0 as my client has already purchased the necessary equipment. This is beneficial as no extra hardware needs to be purchased which makes it readily available and suitable for purpose.

2.4 Program Structure

2.4.1 Top-down design structure charts

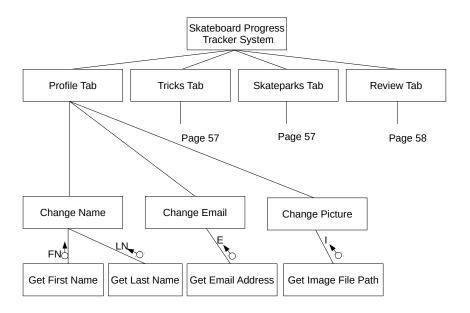

Figure 2.16: Profile Top-Down Design Chart

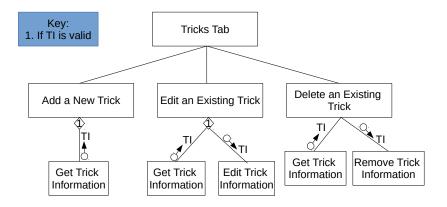

Figure 2.17: Tricks Top-Down Design Chart

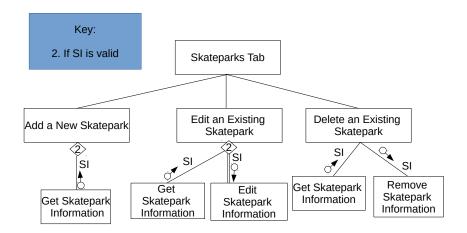

Figure 2.18: Skateparks Top-Down Design Chart

2.5 **Prototyping**

Inserting a Webpage into PyQt

For the 'Skateparks' seciton of my system I would need to be able to add Google maps into my application. For this to work I would need to be able to view a web page in the main window of my PyQt application. I successfully managed to integrate the web page into the main window, this can be seen below.

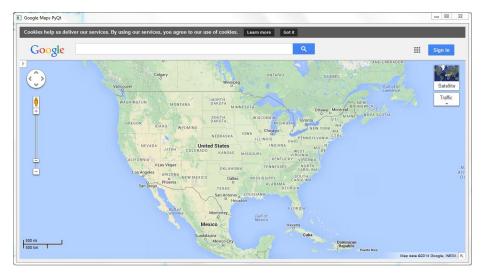

Figure 2.22: Google Maps in Python Application

My code for this is shown below.

```
import sys
  from PyQt4.QtGui import *
  from PyQt4.QtCore import *
  from PyQt4.QtWebKit import *
   class MainWindow(QMainWindow):
       """The main window for my application"""
       def __init__(self):
           super().__init__()
           self.setWindowTitle("Google Maps PyQt")
10
           self.create_layout()
11
12
       def create_layout(self):
           self.label=QWebView()
14
           self.label.load(QUrl("http://www.Google.com/maps"))
           self.label.show()
16
           self.layout=QVBoxLayout()
18
           self.layout.addWidget(self.label)
20
           self.widget=QWidget()
21
           self.widget.setLayout(self.layout)
22
           self.setCentralWidget(self.widget)
23
24
   if __name__ == "__main__":
25
       application = QApplication (sys.argv)
26
       window=MainWindow()
27
       window.show()
       window.raise_()
29
       application.exec_()
```

Google Maps API

For my skateparks section of my program I had to think about a way to represent all the skateparks on the map. I found out after researching about Google maps API, that embedding Google maps into my program using HTML would provide a better user interface then the whole web page as it cuts out the parts of the web page which are not needed. I also found out a way using HTML to place markers which is a possible way of representing the individual skateparks on the map. My code for this is shown below.

```
self.Google_maps=QWebView()
self.html=(',''<iframe width="100%" height="100%"
frameborder="0" style="border:0"
src="https://www.Google.co.uk/maps/embed/v1/place?
key=AIzaSyC5RcJ7vLSEYF32KqDusnuRcLJiHW8EbDg</pre>
```

```
%q=long+road+sixth+form+college
%attribution_source=Google+Maps+Embed+API
%attribution_web_url=http://www.butchartgardens.com/
%attribution_ios_deep_link_id=comGooglemaps://?daddr=long+road+sixth
+form+college"> </iframe>''')
self.Google_maps.setHtml(self.html)
```

This places a marker on the map at my college, Long Road Sixth Form. The code produces an embedded map with a pin marker located at Long Road Sixth Form. This is shown below.

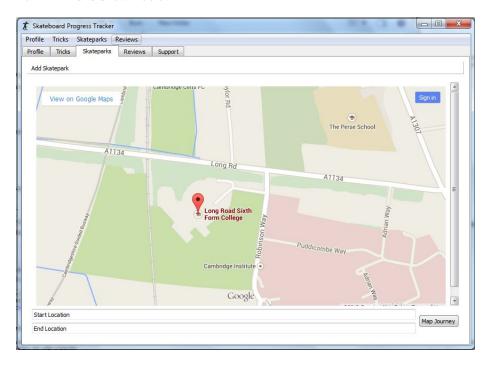

Figure 2.23: Pin Marker on Embedded Google Maps

Using Tabs To Navigate Through Windows

For my system I have decided to use a tabbed interface to navigate through my application. I have never used this form of navigation before and have decided to try and use this aesthetically pleasing and easy to use form of navigation. I investigated tabs and found that this was possible by using a QTabWidget. From this I then used my existing knowledge on how to add widgets to layouts and layouts to windows to produce this code:

```
import sys
  from PyQt4.QtGui import *
  from PyQt4.QtCore import *
  class MainWindow(QMainWindow):
5
       def __init__(self):
           super().__init__()
           self.setWindowTitle("Tabbed Interface")
           self.create_tabs()
10
       def create_tabs(self):
12
           self.tabs=QTabWidget()
13
14
           #Create Widgets
           self.profile_tab=QWidget()
16
           self.tricks_tab=QWidget()
17
           self.skateparks_tab=QWidget()
18
           self.reviews_tab=QWidget()
           self.support_tab=QWidget()
20
           #Add Tabs
22
           self.tabs.addTab(self.profile_tab, "Profile")
           self.tabs.addTab(self.tricks_tab, "Tricks")
24
           self.tabs.addTab(self.skateparks_tab,
25
               "Skateparks")
           self.tabs.addTab(self.reviews_tab, "Reviews")
26
           self.tabs.addTab(self.support_tab, "Support")
27
28
           self.setCentralWidget(self.tabs)
29
30
   if __name__ == "__main__":
31
       application = QApplication (sys.argv)
32
       window=MainWindow()
       window.show()
34
       window.raise_()
       application.exec_()
36
```

Figure 2.24: Tab Navigation Code

This code then produced the window below. This program allowed me to navigate through tabs.

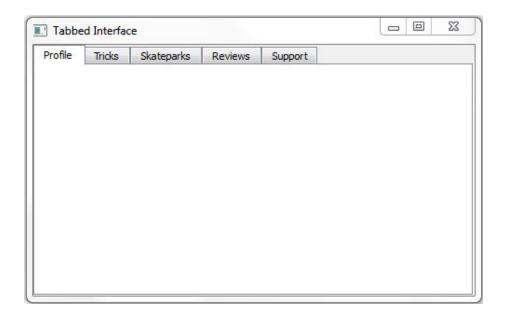

Figure 2.25: Tabbed Navigation in Python Application

Displaying a Database Table into a window

For two areas of my system tables from my database have to be displayed, as this feature is key for my tricks and reviews section I have decided to prototype it. I had previous experience in reading databases and displaying tables but I had never designed a program to read the database automatically from program start-up and display the able instantly. To do this I found out that all I needed to do was manually code the file path to the database; however I needed this to work on every computer in order to make it possible to I used the code below in order to do this.

self.path=("{0}{1}".format(os.getcwd(),"\skateboard_progress_tracker.db"))

2.6 Definition of Data Requirements

2.6.1 Identification of all data input items

Data	Description
FirstName	The first name of the user
LastName	The last name of the user
UserPicture	The picture selected by the user
	for a profile picture
UserEmail	The email address of the user
TrickName	The name of a trick being added
	to the trick table
TrickDescription	The description of the trick being
	added to the trick table
TrickObsitcle	Any obstacle needed to perform
	the trick being added to the trick
	table
TrickImage	The picture selected by the user
	for the trick being added to the
	trick table
TrickTutorialLink	The video link for a tutorial for
	the trick being added to the trick
	table
TrickDifficulty	The difficulty of the trick being
	added to the trick table
SkateparkName	The name of a skatepark being
	added to the skatepark table
SkateparkCoordinates	The coordinates of the skatepark
	being added to the skatepark ta-
	ble
SkateparkDescription	The description of the skatepark
	being added to the skatepark ta-
	ble
ReviewDescription	The written review for a product
ProductBrand	The brand of the product that is
	being reviewed
ProductName	The name of the product being
	reviewed
ProductSize	The size of the product being re-
	viewed
ReviewRating	The rating of the product being
	reviewed

2.6.2 Identification of all data output items

Data	Description
UserPicture	The picture selected by the user
	for a profile picture
TrickImage	The picture selected by the user
	for the trick being added to the
	trick table
TrickCompleted	A checkbox indicating a trick is
	completed
TrickCompletedDate	A date indicating when the trick
	was completed
ReviewDescription	The written review for a product
	will be displayed when the review
	filter fits the reviews criteria
ProductBrand	The brand of the product that is
	being reviewed will be displayed
	when the review filter fits the re-
	views criteria
ProductName	The name of the product being
	reviewed will be displayed when
	the review filter fits the reviews
	criteria
ProductSize	The size of the product being
	reviewed will be displayed when
	the review filter fits the reviews
	criteria
ReviewRating	The rating of the product being
	reviewed will be displayed when
	the review filter fits the reviews
	criteria

2.6.3 Explanation of how data output items are generated

The UserPicture and TrickImage is displayed to the user by a file path which is selected by the user in the setting up of the profile and when the user is adding a trick.

The TrickCompleted is generated by the user clicking the checkbox to show that they have completed that trick. This will then display the checkbox as being checked.

The TrickCompletedDate is generated the the users clock on their computer. The date will be generated by the python function to call the time now. This date will then be displayed in the same column as the TrickCompleted checkbox.

The ReviewDescription, ProductBrand, ProductName, ProductSize and ReviewRating are all placed through a query to determine whether the review fits the criteria of the specific filter. If the review data fits the review filter then the data will be displayed to the user.

2.6.4 **Data Dictionary**

My Data Dictionary is displayed below, this contains quite a few modifications since my analysis section. This is because I have realised that for filtering through information I would need more attributes so that users can't spell things such as brand names wrong. Additionally I have decided to add some more user features such as a user picture so that the user interface will be better to look at and more user friendly.

Data dictionary

Name	Data Type	Length	Validation	Example Data	Comment
UserID	Interger	10 Numbers	None	1	Unique identifier

ProductName	String	25 characters	None	Cosmic Tiger	Moderated
ProductSizeID	interger	10 numbers	None	1	Unique identifier
					for a size.
ProductSize	String	20 characters	None	7.875"	Moderated

2.6.5 Identification of appropriate storage media

A Hard Drive Disk (HDD) will be an appropriate storage media as the system and its data (database) needs to be stored in a way which is easily accessible for the system to use. As Stuart's laptop has a HDD built in as its main source of storage, this is the only suitable storage media for his situation. An external HDD will also allow for long term memory storage and allow for syncing between two computers, whilst also suiting the purpose of storing a back up. This is due to the external HDD's portability and security properties.

2.7 Database Design

2.7.2 SQL Queries

For all of my SQL queries I will be using Python to format the SQL query text strings.

Query to Show Filtering the Product Type

The query below shows the SQL query that will be used to filter the reviews for a specific product type. This takes all the information from a review (in the Review table) and displays it if the ProductTypeID (from the ProductType table) equals the filter that is set. The filter will be selected via a drop down box in the 'Filter reviews' pop-out.

```
SELECT *
FROM Review, Product
WHERE Product.ProductTypeID=?
```

Query to Show Filtering the Product Size

The query below shows the SQL query that will be used to filter the reviews for a specific product size. This takes all the information from a review (in the Review table) and displays it if the ProductSizeID (from the ProductSize table) equals the filter that is set. The filter will be selected via a drop down box in the 'Filter reviews' pop-out.

```
SELECT *
FROM Review, Product
WHERE Product.ProductSizeID=?
```

Query to Show Filtering the Product Brand

The query below shows the SQL query that will be used to filter the reviews for a specific product brand. This takes all the information from a review (in the Review table) and displays it if the ProductBrandID (from the ProductBrand table) equals the filter that is set. The filter will be selected via a drop down box in the 'Filter reviews' pop-out.

```
1 SELECT *
2 FROM Review, Product
3 WHERE Product.ProductBrandID=?
```

Query to Show How Many Tricks Have Been Completed

The query below shows the SQL query that will be used to find how many tricks have been completed. This SQL query generates the basis for my progress tracker algorithm shown in a previous section.

```
SELECT TrickID
FROM Trick
WHERE TrickCompleted=True
```

Query to Show How Many Tricks are in the Trick Table

The query below shows the SQL query that will be used to find out how many tricks are in the trick table. This SQL query also generates the basis for my progress tracker algorithm shown in a previous section.

```
SELECT TrickID
FROM Trick
```

Query to Order the Trick Database in Alphabetical Order

The query below shows how I will order the trick QTableView in my program to display all the tricks in alphabetical order.

```
SELECT *
FROM Trick
ORDER BY TrickName ASC
```

2.8 Security and Integrity of the System and Data

2.8.1 Security and Integrity of Data

Due to the system containing some private information about a living individual (name and email), the new system will have to abide by the data protection act.

Location data about the user will need to be secured as that information could be used to find out where a living person is going. To make sure that the data that is stored is also valid, at the input stage, drop down menus will be used when necessary e.g reviews brand. Wherever the user types in the information via the keyboard, the data will be checked to make sure that it is acceptable by the validation discussed in the next section. I will also need to make sure that I keep referential integrity in my database. I have desided to stick with the default: ON UPDATE RESTRICT ON DELETE RESTRICT as this will prevent users of my system from mistakenly altering the database in an unexpected way.

2.8.2 System Security

It is important that the system is protected from data theft, corruption and tampering. The database will be encrypted to avoid people accessing the information without the use of the system. As my program must abide by the data protection act I must ensure that the data:

- Will not be transferred to other countries.
- Will be secured securely so only authorised users can access it. To enforce this my database will be encrypted.
- Will be destroyed after 11 years of collection. To enforce this after 11 years the user will be forced to re-enter the personal data that the program stores before being able to access the program (name and email address).
- Will be accurate and up to date. To enforce this, periodicly the program will display pop-ups reminding the user to ensure the information stored on the database is correct.
- Will be necessary. To enforce this, as the programmer I will only use the data for the specific purposes for which it was collected, e.g Profile Picture to display on the individuals users profile page.

2.9 Validation

To avoid any incorrect data entries from being added to the database the system needs to carry out some validation searches to ensure that each piece of information being added to the database is in acceptable parameters.

Item	Example	Validation	Justification	
FirstName	Ben	Presence, no num-	To ensure a first	
		bers, no special	name is entered and	
		characters	with only accept-	
			able characters

2.10 Testing

2.10.1 Outline Plan

Test Series	Purpose of Test Series	Testing Strategy	Strategy Rationale
1	Test the flow of control between	Top-down testing	I habe chosen top-down
	user interfaces		testing as the flow of user
			interfaces is hierarchical
			due to the fact there are
			multiple interfaces which
			stem from an original,
			main interface
2	Validation of input data per-	Bottom-up Testing	I have chosen bottom-up
	formed corrected		testing as I need to test
			the lower levels of data in-
			put to ensure the informa-
			tion has been entered into
			the database. Only then I
			will be able to test other
			areas that use that infor-
			mation from the database
3	Test information input is stored	White box testing	I have chosen white box
	in the correct place		testing as I will have to
			look into the database af-
			ter I have inputted the
			data using the program
			to see that the data has
			been entered in the correct
			place
4	Test algorithms and SQL	Black box testing	I have chosen black box
	Queries to ensure the output is		testing as I will see
	correct		whether or not the algo-
			rithm/query has returned
			the correct values, with-
			out looking at the internal
			structure of the code
5	Test that the system fulfils the	Acceptance testing	I have chosen acceptance
	specification		testing as this test is con-
			ducted to determine if the
			specification is met

Chapter 3

Testing

3.1 Test Plan

107

3.1.1 Original Outline Plan

Test Series	Purpose of Test Series	Testing Strategy	Strategy Rationale
1	Test the flow of control between	Top-down testing	I have chosen top-down
	user interfaces		testing as the flow of user
			interfaces is hierarchical
			due to the fact there are
			multiple interfaces which
			stem from an original,
			main interface
2	Validation of input data per-	Bottom-up Testing	I have chosen bottom-up
	formed corrected		testing as I need to test
			the lower levels of data in-
			put to ensure the informa-
			tion has been entered into
			the database. Only then I
			will be able to test other
			areas that use that infor-
			mation from the database
3	Test information input is stored	White box testing	I have chosen white box
	in the correct place		testing as I will have to
			look into the database af-
			ter I have inputted the
			data using the program
			to see that the data has
			been entered in the correct
			place
4	Test algorithms and SQL	Black box testing	I have chosen black box
	Queries to ensure the output is		testing as I will see
	correct		whether or not the algo-
			rithm/query has returned
			the correct values, with-
			out looking at the internal
			structure of the code
5	Test that the system fulfills the	Acceptance testing	I have chosen acceptance
	specification		testing as this test is con-
			ducted to determine if the
			specification is met

$3.1.2\quad \hbox{Changes to Outline Plan}$

There were no changes made to my outline plan.

- Test 1.01 I changed the details of the test as I have changed my user interface of my program to contain line edits which become read only and editable rather than a pop-out form that you fill in as this made the program more aesthetically pleasing.
- Test 1.02 I changed the details of the test as I have changed my user interface of my program to contain line edits which become read only and editable rather than a pop-out form that you fill in as this made the program more aesthetically pleasing.
- Test 1.05 I changed the details of this test as I have changed my user interface of my program to contain line edits in a side form which becomes available once the 'add trick' button is pressed. I felt this was more aesthetically pleasing than a pop-out.
- Test 1.06 I changed the details of this test as I have have not implemented an edit trick functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.
- Test 1.07 I changed the details of this test as I have changed my user interface of my program to select a row and press delete to delete a trick.
- Test 1.09 I changed the details of this test as I have changed my user interface of my program to contain line edits in a side form which becomes available once the 'add skatepark' button is pressed. I felt this was more aesthetically pleasing than a pop-out.
- Test 1.10 I changed the details of this test as instead of clicking on the skatepark marker, all you need to do is hover over the marker to receive information about the skatepark.
- Test 1.11 I changed the details of this test as I have have not implemented an edit skatepark functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.
- Test 1.12 I changed the details of this test as I have have not implemented an delete skatepark functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.

- Test 1.15 I changed the details of this test as I have have not implemented an add review functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.
- Test 1.16 I changed the details of this test as I have have not implemented an edit review functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.
- Test 1.17 I changed the details of this test as I have have not implemented an delete review functionality to my user interface, therefore I have used my old CLI program to make the changed to the database.
- Test 2.00 I changed the details of the test as I have changed my user interface of my program to contain line edits which become read only and editable rather than a pop-out form that you fill in as this made the program more aesthetically pleasing.
- Test 2.02 I changed the details of the test as I have changed my user interface of my program to contain line edits which become read only and editable rather than a pop-out form that you fill in as this made the program more aesthetically pleasing.

Figure 3.7: Evidence for Test 2.03 Part 1

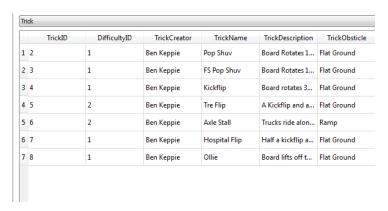

Figure 3.8: Evidence for Test 2.03 Part 2 $\,$

The screen shots above show that when adding a trick, the trick gets successfully added to the database, therefore this test was successful.

Test 2.06 Evidence

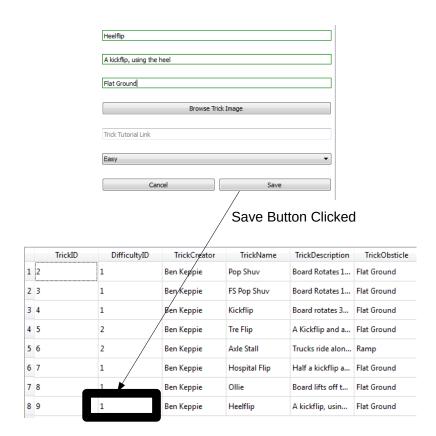

Figure 3.9: Evidence for Test 2.06 Part 1

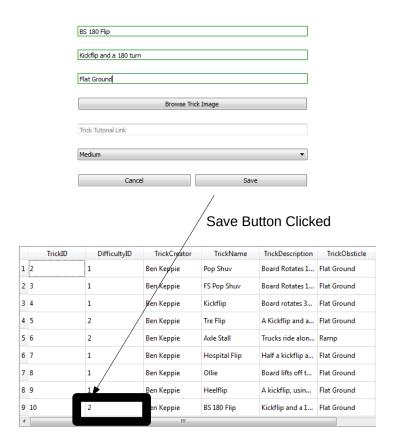

Figure 3.10: Evidence for Test 2.06 Part 2

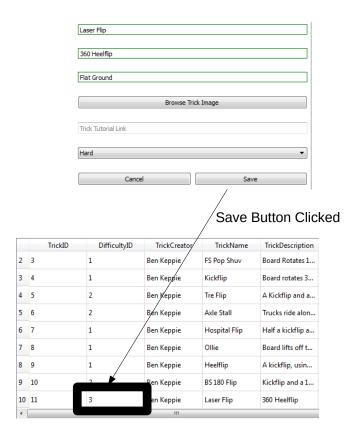

Figure 3.11: Evidence for Test 2.06 Part 3

The screen shots above show that the 'easy', 'medium' and 'hard' tricks have a corresponding integer value (1, 2 and 3 respectively) and when the trick is saved, the integer value is shown in the table. This test was therefore successful.

Test 3.00 Evidence

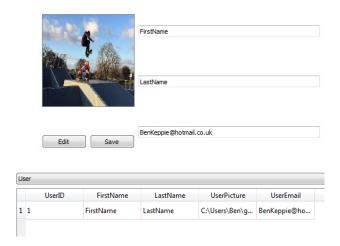

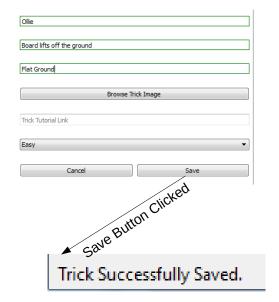

Figure 3.12: Evidence for Test 3.00

The screen shot above shows that when a name is saved in the line edits on the 'profile' tab, the values are placed into the database. This test was successful.

Test 3.03 Evidence

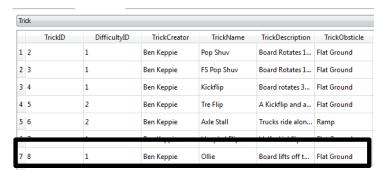

Figure 3.13: Evidence for Test 3.03

The screen shot above shows that when a trick is saved, the values are placed into a database and this is shown by a status bar message that is displayed. This test was successful.

Test 3.09 Evidence

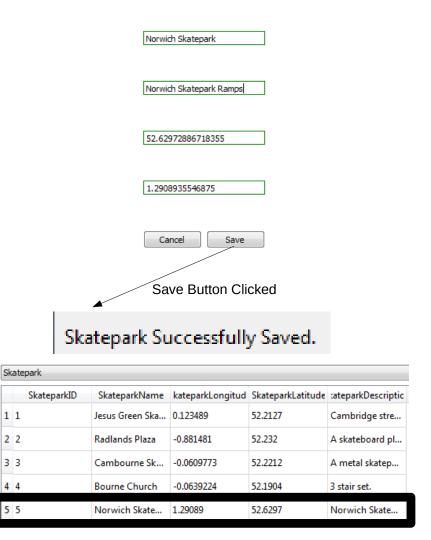

Figure 3.14: Evidence for Test 3.09

The screen shot above shows that when a skatepark is saved, the values are placed into a database and this is shown by a status bar message that is displayed. This test was successful.

Test 4.05 Evidence

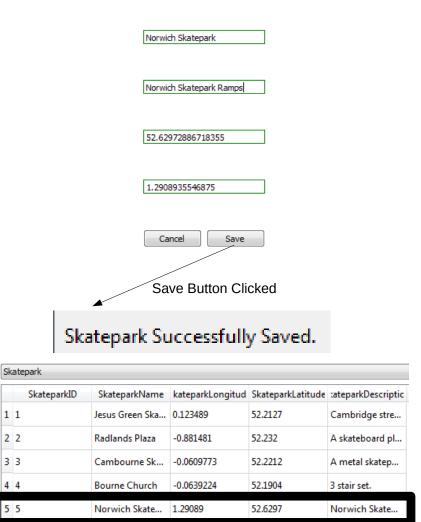

Figure 3.15: Evidence for Test 4.05 Part 1

1 1

2 2

3 3

4 4

5 5

Figure 3.16: Evidence for Test 4.05 Part 2

The screen shot above shows that the values of the database for the skatepark correspond to the location of the marker on the google map image.

Test 5.00 Evidence

All of the previous annotated samples contribute to Test 5.00. There are elements of my program which work as intended e.g The name line edit did not contain the correct validation which lead to the failure of that test series (Figure 3.6 on page 158). On the other hand most of my tests passed e.g saving tricks (Figure 3.13 on page 165).

3.4 **Evaluation**

3.4.1 Approach to Testing

For each of my test series I used a different approach to testing. For my first test series I chose to use top-down testing as the flow of user interfaces was hierarchical. This was the best option as there are multiple interfaces which stem from the original interface. For my second test series I chose bottom-up testing as I needed to test the lower levels of data input to ensure the information had been entered into the database. Following this, it allows me to test other areas of my program which use the information from the database. For my third test series I chose to use white box testing as I for the individual tests I have to look inside the database after inputting information into the program, which then adds the data to the database. For my fourth test series I chose black box testing as I was checking to see if algorithms returned the correct value without looking at the internal structure of the code. Finally, for my fifth test series I chose acceptance testing as this is conducted to determine if the specification is met.

3.4.2 Problems Encountered

Testing my program allowed me to identify areas of the system which did not work as intended. These tests are identified below, with an explanation. I will endeavour to fix all of the errors for the final release of my program which I will give to my client.

Test 2.00 and Test 2.02

The line edits in the 'profile' tab which allow you to edit your first name, last name and email did not include any validation on them. This is a minor issue that could easily be fixed by a short validation method.

Test 2.01 and Test 2.05

When uploading pictures for the program, the file type accepted was supposed to be limited to a .jpeg file; however the program accepted any file type. This is a minor problem, but can be annoying as file types that aren't .jpeg will not be displayed. For example, if a .txt file is uploaded for the profile picture, the profile picture will appear to be blank. This could easily be fixed by a short validation method and then a message being displayed on the status bar.

Test 5.00

The build up of minor errors, along with the fact that the graphical user interface is not complete within the reviews tab, has lead to the failure of this test. For this test to pass the whole program would have to be completed at a usable graphical user interface level, along with every test series passing. This means I am not that far off passing this test as all that needs to be done is a few validation methods in certain input areas and the review table input form functionality.

3.4.3 Strengths of Testing

I feel that my testing methods were particularly strong. This was partnered with the large amount of individual tests in each test series to show which parts of my program worked, and which parts didn't. The use of multiple different testing types allowed for my system to be tested in many different aspects which then gave a rigorous analysis of the functionality of my program. My testing allowed me to see if the functions made the correct changes to the database and user interface.

3.4.4 Weaknesses of Testing

The weakness of my testing is the fact that not every single aspect of my program was identified, therefore there could be some areas of my program which have errors in, of which I do not know about. My testing also doesn't look at the internal structure of the code. This means that there could be parts of my code

which are inefficient and therefore could be coded in a much more efficient way which would lead to less processing power needing to be used as well as a faster program.

3.4.5 Reliability of Application

The reliability of my program is questionable. It carries out most of the initial functions that I set for it to do; however some key features are missing and my testing has highlighted those areas. With a few minor tweaks, these issues would be rectified. The two main problems with the reliability of my program lie within the validation of some fields and the mixed program usage (graphical user interface and command line interface). As I didn't have time to complete the command line interface, some of the functionality (the review tab) is only available to use in a command line interface. This is not a problem within the functionality, but for my client, this form of information editing is not acceptable. None of the image parts of my program validate the file type which is a key contributing factor to the decreases reliability of my program. Looking back on my program I should have changed some of the entry field to fixed combo boxes as the some of the information that can be entered into the database could be inaccurate, and therefore my program is only as reliable if the data input is accurate.

3.4.6 Robustness of Application

Even though my application failed a few of its test series, I would still deem my program robust. Regardless of whether parts of the program didn't work, at no time did this cause the program to crash, lose any data or start an infinite loop which would leave the program unable to use. With some of my input fields, even if data is not designed to go into an input field, an error message is displayed and the program continues as normal. This is a good quality of my program as the support section will allow for users to report errors that happen as the program doesn't crash due to the errors. This will then allow for me to identify the error, fix it and send out a new release of the program.

Chapter 4

System Maintenance

4.1 Environment

4.1.1 Software

During the implementation of my program I used a variety of software items to help me create the program for my client. The software I used is detailed in the bullet points below.

- Python 3.4
- IDLE (python GUI)
- PyQt 4
- SQLite3
- smtplib
- SQLite Inspector
- Notepad ++ v6.6.7
- Google Chrome

4.1.2 Usage Explanation

The table below gives details of why I decided to use the software I used.

Software	Justification for Use
Python 3.4	Python is the programming language I am most con-
	fident with as I have been learning it through the
	past two years at college. Python is also the most
	supported program at my college.
IDLE (python GUI)	This programming editor comes with the free instal-
	lation of Pyton, and is the only programming envi-
	ronment available at my college.
PyQt 4	This software is an add on to the python program-
	ming language which allowed for me to create a
	graphical user interface for my program.
SQLite 3	This software came along with the Python 3.4 library
	and I also had some previous experience of using it,
	therefore I used it to handle my SQL queries.
smtplib	This module came along with the Python 3.4 library
	and allowed me to send emails to me (the developer)
	about any bugs in the program.
SQLite Inspector	This piece of software allowed me to look inside my
	database and test SQL queries. This was available
	for me to use at college and home as my teacher
	created it.
Notepad $++$ v6.6.7	This piece of software allowed me to test my
	JavaScript code and allowed me to debug any for-
	matting errors as JavaScript isn't formatted nicely
	in IDLE.
Google Chrome	I am familiar with using this web browser and it also
	has plenty of compatibility with lots of programming
	languages therefore I used this to view my Javascript
	script.

Another reason for using all the programs I have used is the fact that they are free to download from the internet, which therefore creates a free application for my client to use.

4.1.3 Features Used

Software	Features Used
Python 3.4	I used python to run my program which allowed me
	to test the graphical user interface of my program.
	I also used the code libraries which came with the
	installation of Python to code my system.
IDLE (python GUI)	I used IDLE to write out my code and save it as
	a python file. I took advantage of the colour coded
	syntax and also the code predictor. I also used IDLE
	to run the python file.
PyQt 4	I used PyQT extensively, from using pre-
	programmed classes such as QVBoxLayout to
	rewriting some classes such as the QWebPage class.
	PyQT was used to create the graphical user interface
	of my program.
SQLite 3	I used this piece of software to write SQL queries that
	would allow me to add,edit, delete and retrieve data
	from my database and ensure referential integrity
	was enforced.
smtplib	I used the email sending capabilities of this module.
SQLite Inspector	I used SQLite inspector for two functions. First of
	all I used it to check that data had been added/edit-
	ed/deleted properly. Secondly I used it to check that
	my SQL statements were correct.
Notepad ++ v6.6.7	I used this piece of software to debug and write the
	Javascript for my google maps integration found in
	the 'skatepark' tab of my program.
Google Chrome	I used Google Chrome to check that my Javascript
	code functioned properly inside a web browser. I also
	took advantage of the 'developer' features of google
	chrome to debug my Javascript.

4.2 System Overview

4.2.1 General User Interface

On every part of my user interface a QMenuBar is at the top, allowing you to access functionality of any tab from anywhere in the program, for example if you are on the profile tab you can click on the 'support' part of the QMenuBar and click 'contact support' on the drop down options and the view of the program will change to the support tab and load the correct widgets to allow for the

user to contact support. A QStatusBar is also available on every page which displays messages at appropriate times, informing the user about changes that have occurred.

4.2.2 Profile Tab User Interface

The profile tab consists of a QToolBar at the top of the tab labeled 'Change Picture' widget allowing you to change your profile picture which is displayed in a QGraphicsScene. Below the profile picture there are 2 QPushButtons labelled 'Edit' and 'Save'. To the right of this there are three QLineEdits showing the users first name, last name and email address, to the right of these QLineEdits is a Recently completed tricks list. Below the tabbed interface a QProgressBar which shows the percentage of completed tricks.

4.2.3Editing Profile Table Information

Once the edit button is clicked the QLineEdits containing the first name, last name and email address of the user become available to edit. Once the QLineEdits have been changed you may click the 'save' button to save the changes. Once the 'Change Picture' button is pressed a QFileDialog appears allowing you to choose an image from your documents to set as your profile picture.

4.2.4 Tricks Tab User Interface

The tricks tab also contains the QProgressBar below the tabbed interface. There is also a QToolBar with an option to add a trick. Below the QToolBar a QTableView displays all of the items in the tricks table of the database. Once the 'Add Trick' button is pressed a side form appears on the left hand side with QLineEdits, QPushButtons and QComboBoxes which allow you to fill in information about a trick.

4.2.5**Editing Trick Table Information**

Once the 'Add Trick' button has been pressed you can fill in information about a trick, once the 'save' button below the form has been pressed the trick will be saved to the database if all the fields are valid. If a field is invalid then the invalid fields will be highlighted red. To delete a trick you select the row you wish to delete and then press the delete key, a confirmation message will appear and you click the 'save' button to accept the delete. To edit a trick you have to run through the CLI menu and then run through the appropriate steps.

4.2.6 Skateparks Tab User Interface

The Skateparks tab interface is similar to that of the Tricks tab, but the table is replaced with a QWebView of the Google map.

4.2.7**Editing Skatepark Table Information**

To add a skatepark you click on the Google Maps object, the program will then automatically fill in the latitude and longitude of the marker. Then you need to fill in the skatepark name and description. Then click save to save the skatepark to the database. To edit or delete a skatepark you have to run through the CLI menu and run through the appropriate steps

4.2.8 Reviews Tab User Interface

The Review user interface is similar to the tricks tab. But the table is replaced with information about reviews.

Editing Review Table Information 4.2.9

To edit the review table you have to run through the CLI menu and run thorugh the appropriate steps.

4.2.10Support Tab User Interface

The support tab consists of a QLabel containing my details as the application developer and a series of QLineEdits allowing the user to enter information to send a bug. A 'submit' QPushButton is below this form.

4.2.11Reporting a Bug

A series of QLineEdits must be filled in, in order to send a message about a bug in the program. This includes: Users name and email address, as well as the actual message saying what the bug is.

4.3 Code Structure

My general code was structured around a graphical user interface where I have incorporated PyQt functions and object orientated programming concepts which I have developed over the past two years of learning python.

4.3.1 Particular Code Section

4.4 Variable Listing

My data dictionary can be found on Figure 2.6.4 on page 76.

4.5 System Evidence

4.5.1 User Interface

Chapter 6

Evaluation

6.1 Customer Requirements

Below is a list of all my general and specific objectives that I set myself in the analysis section. In this section I will determine whether I have met all of these objectives and the reasoning behind it. The subsections with *NEW* in the title are objectives that I did not identify in my analysis section; however during the course of my implementation, I attempted to meet the objectives.

- 6.1.1 Aesthetically pleasing, easy to navigate GUI.
- 6.1.2 Videos organised and filtering capabilities.
- 6.1.3 Correct and accurate mapping to the skate park-s/spots.
- 6.1.4 Correct directions from current location to skate park/ spot on the map.
- 6.1.5 Non-biased reviews.
- 6.1.6 Clear database with a list of tricks in.
- 6.1.7 Easy to filter through tricks known.
- 6.1.8 Display status bar messages at appropriate times to inform the user of changes *NEW*
- 6.1.9 Allow for the user to contact the developer *NEW*
- 6.1.10 Ensure that the profile picture can be changed easily NEW*
- 6.1.11 Ensure that the profile name can be edited easily *NEW*
- 6.1.12 Ensure that the profile email can be edited easily *NEW*
- 6.1.13 Ensure that videos can be filtered by categories. e.g easy, medium, hard tricks.
- 6.1.14 Ensure that videos load correctly and are linked to the right video.
- 6.1.15 Ensure that videos are displayed at the correct size/resolution that the monitor of the computer is.
- 6.1.16 Ensure the database can add, edit and remove trick data (Name, description, image, completed status and tutorial link).
- 6.1.17 Ensure that the database is displayed correctly inside the application at all resolutions.
- 6.1.18 Ensure that the tricks are marked by how hard they are by a three way scale of: Easy, Medium or
